

ECOSYSTEMS IN TAYGETA – SYMBIOSIS IN NATURE

Conocimiento Pleyadiano

In this video, Anéeka of Temmer, an extraterrestrial woman from the star Taygeta in the Pleiades cluster, explains what her planets are like. What they are based on and how their ecosystems function. She tells us a lot about the flora and fauna of its two main planets; Temmer and Erra.

"This information is provided by extraterrestrial persons, women and men from the Taygeta star in the Pleiades cluster, through a written contact with us."

Temmer and Erra are very peaceful planets, few things hurt you there. They are based on symbiotic ecosystems, not aggressive exploitation - so-called 'super-habitable' planets. There are two other planets in Taygeta, Procyon (nothing to do with the star of the similar name Proceon) and Dakote.

Procyon is a very hot and hostile planet, with a gravity of 1.2 G. where you weigh 20% more than on Earth compared to Temmer and Erra with 0.8 G. And there

everything is hostile. Everything wants to make you its dinner, everything is toxic. Everything is carnivorous, the Law of the Jungle. A stark contrast between Temmer and Erra and Procyon.

Dakote on the other hand, has little fauna, has a gravity of 0.7 G, but is very cold. In Taygeta we are few people in total, it is not necessary to invade anything, nature is free and the funny thing is that it corresponds equally.

Because unlike what happens on Earth, it is very rare or very strange for a hurricane or destructive storm to form or occur. So it is a constant, efficient and benign climate. It favors life and its proliferation. On the other hand, on Earth there are many parasitic ecosystems, unlike on Erra and Temmer where there is more symbiosis. On Earth it is noticeable in things like the proliferation of poisonous or spiny plants, while in Erra or Temmer there are more phosphorescent plants, which indicates not a 'get out', but a 'come to me' for insects. Another mentality still in plants and insects. That is, they attract insects, they do not try to repel them. Also, we have very few predator animals, as the system is symbiotic in nature, not parasitic, as I understand it.

Even in the seas, it is characterized by the high population of cetaceans and the absence of sharks. On the contrary, on Earth, if you see a beautiful, warm and crystalline sea, you know that there are sharks. In Temmer that same sea is full of dolphins and is friendly to swim in. Also, dolphins are curious and friendly. These abound in Temmer and Erra, but in Temmer, especially. Temmer is a mostly water planet, it has few solid or dry continents, it has a mild climate, two marked seasons.

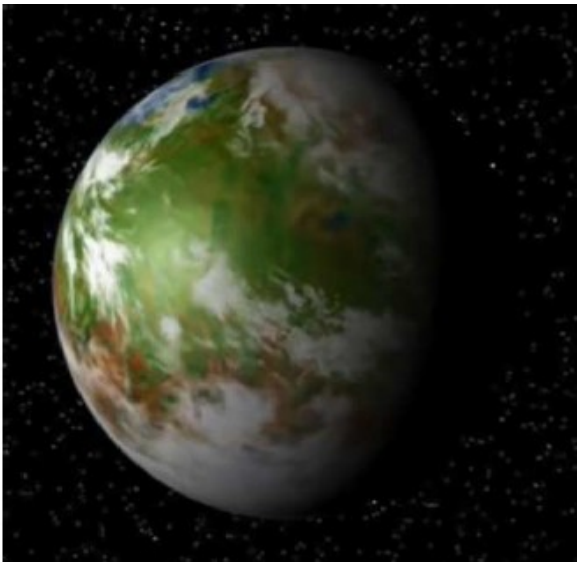

A tropical Paradise planet where palm trees abound, they are everywhere, far from being a species only on Earth. In addition, Temmer has a great variety of birds, also fish and cetaceans. Seeing the fountain of a whale in the distance or several on the Temmerian horizon is a common scene and nobody bothers them.

In Temmer there is a lot of, let's say water sports, almost everything is dedicated to that. On the coasts there are many small sailboats as well. Its sea lends itself to navigation, since storms are rare. And the propeller is not used to drive boats. The propellers are very harmful to sea lions, cetaceans, dolphins and fish. The boats are not all sailing, the magnetic water jet is used. The work or cargo boats are powered, but they are magnetic so as not to harm the fauna. Water jet .Which work through magnetism compressing the water, which passes through a tube and throws it back. In the event that a fish enters the tube, it comes out the other side, maybe dizzy, perhaps, but not hurt. And all power is zero point, without cables or with a minimum of cables.

Erra, on the other hand, is a planet with a very changeable climate, it is usually cold. Winter is strong. Also, two marked seasons. The planet is covered by large coniferous forests.

In Erra there are plants that run away if disturbed. The little plants are rounded bushes that if you pass and disturb one, they run away senseless, hitting each other and against objects and other plants and trees. And then they calm down. I guess they do it to prevent being eaten or scare the animal. But they have no sense of where they are running or see obstacles. They are like explosions of movement, of rearrangement, of which plant goes where. When the stimulus disappears they calm down again and will not move until the next stimulus. They live in areas with high soil moisture content, in the forrests of Erra. There are many species that do this, their roots

are like little legs, they are very superficial and they are retractable. And they can move at astonishingly fast speeds, much like a person would run. They are from high mountain forests.

In Taygeta also some species of trees, they uproot and walk very slowly towards places that better accommodate them. It may take weeks to move just a few feet, but they do move and I'm talking about big trees. In Erra what a tree does is look for the best soil, but they are very very slow. Weeks to move a few meters. The Ents do exist, but without the anthropomorphic faces. They don't speak either, just telepathically. (Ents.- Talking and mobile trees from the Lord of the Rings) There are also plants that emit noise. In many places there are plants that emit noise, but not like lungs, as an animal would do with vibrations or blows. They move. In Erra, Temmer or Procyon at least. The noise is like a click, it seems that it is to attract insects for pollination. They usually do it in spring, they don't do it all year round. Like photoluminescence, they compete for the attention of insects. Or they scare them away depending on the color.

It must be remembered here that in Erra, as in other places, the ecosystem is based mainly on symbiosis. Not in competition and / or parasitic exploitation. There are not many predators. Procyon, on the other hand, is something else, there it is plagued with dangerous animals and insects. Regarding the predators in Erra there are wolves, coyotes, foxes and carnivorous felines. That's the biggest there is when it comes to carnivores. In Temmer or Erra you can confidently go into the sea and into the forest as well. The felines tend to stay away from people, but the wolf does not, that one is very curious about people. But you don't hear of many ugly incidents to tell, involving the wolves of Erra.
